Chart Parsing

Asst. Prof. Dr. Nuttanart Muansuwan

Review: simple context-free grammar for a fragment of English

CFG example

CFG's are also called phrase-structure grammars.

Equivalent to Backus-Naur Form (BNF).

- | | |
|---------------------------|-------------------------------------|
| 1. $S \rightarrow NP VP$ | 5. $NAME \rightarrow \text{Beavis}$ |
| 2. $VP \rightarrow V NP$ | 6. $V \rightarrow \text{ate}$ |
| 3. $NP \rightarrow NAME$ | 7. $ART \rightarrow \text{the}$ |
| 4. $NP \rightarrow ART N$ | 8. $N \rightarrow \text{cat}$ |

- CFG's are *powerful* enough to describe most of the structure in natural languages.
- CFG's are *restricted* enough so that efficient parsers can be built.

Parsing Strategies: top-down vs. bottom-up

General Parsing Strategies		
Grammar	Top-Down	Bottom-Up
1. $S \rightarrow NP VP$	$S \rightarrow NP VP$	$\rightarrow NAME\ ate\ the\ cat$
2. $VP \rightarrow V NP$	$\rightarrow NAME VP$	$\rightarrow NAME V\ the\ cat$
3. $NP \rightarrow NAME$	$\rightarrow Beav VP$	$\rightarrow NAME V ART\ cat$
4. $NP \rightarrow ART N$	$\rightarrow Beav V NP$	$\rightarrow NAME V ART N$
5. $NAME \rightarrow Beavis$	$\rightarrow Beav ate NP$	$\rightarrow NP V ART N$
6. $V \rightarrow ate$	$\rightarrow Beav ate ART N$	$\rightarrow NP V NP$
7. $ART \rightarrow the$	$\rightarrow Beav ate the N$	$\rightarrow NP VP$
8. $N \rightarrow cat$	$\rightarrow Beav ate the cat$	$\rightarrow S$

A top-down parser

A parsing algorithm –

uses grammatical rules to search for a combination that generates a tree describing the structure of the input sentence

A top-down parser –

starts with the S symbol and rewrite it into a sequence of terminal symbols that matches the words in the input sentence

Some problems with top-down parser

- Start with S, so it only focuses on grammaticality.
- Not explore possible derivations or rules.

Chart Parser

Chart Parsers

chart: data structure that stores partial results of the parsing process in such a way that they can be reused. The chart for an n -word sentence consists of:

- $n + 1$ **vertices**
- a number of **edges** that connect vertices

Chart parsing: the general idea

- The process of parsing an n - word sentence consists of a chart with $n+1$ vertices and adding edges to the chart one at a time.
- Goal: to produce a complete edge that spans from vertex 0 to n and is of category S

Bottom-up chart parsing

- 1. $S \rightarrow NP VP$
 - 2. $NP \rightarrow ART ADJ N$
 - 3. $NP \rightarrow ART N$
 - 4. $NP \rightarrow ADJ N$
 - 5. $VP \rightarrow AUX VP$
 - 6. $VP \rightarrow V NP$
- Grammar 2.

- Example: given Grammar 2 and a sentence that starts with ART, the parser uses ART to match with rules 2 and 3.
 - use \circ to indicate what has been seen so far
 - thus,

$NP \rightarrow ART \circ ADJ N$

$NP \rightarrow ART \circ N$

An example of chart parsing algorithm

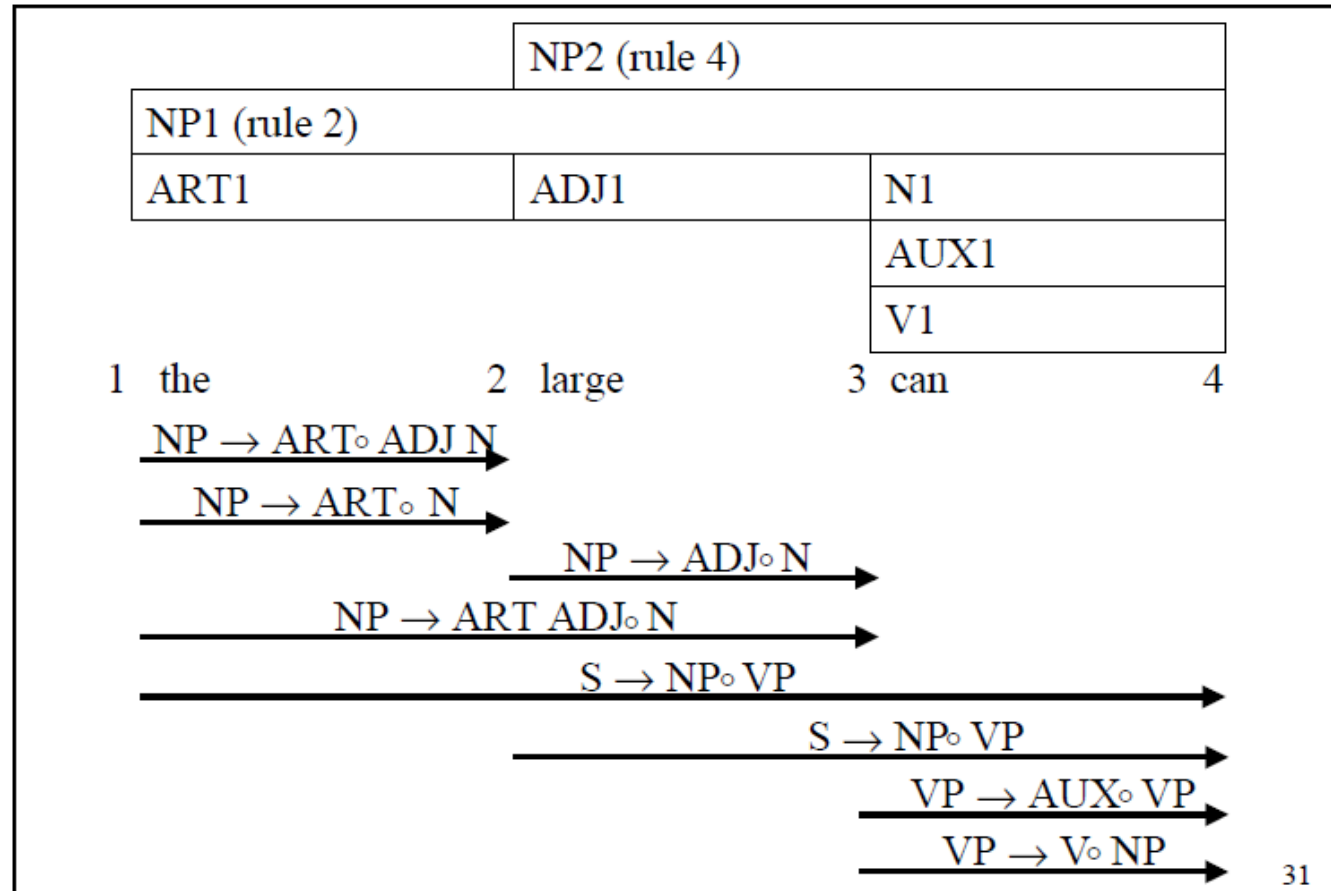

- Consider using the algorithm on the sentence

“The large can can hold the water”

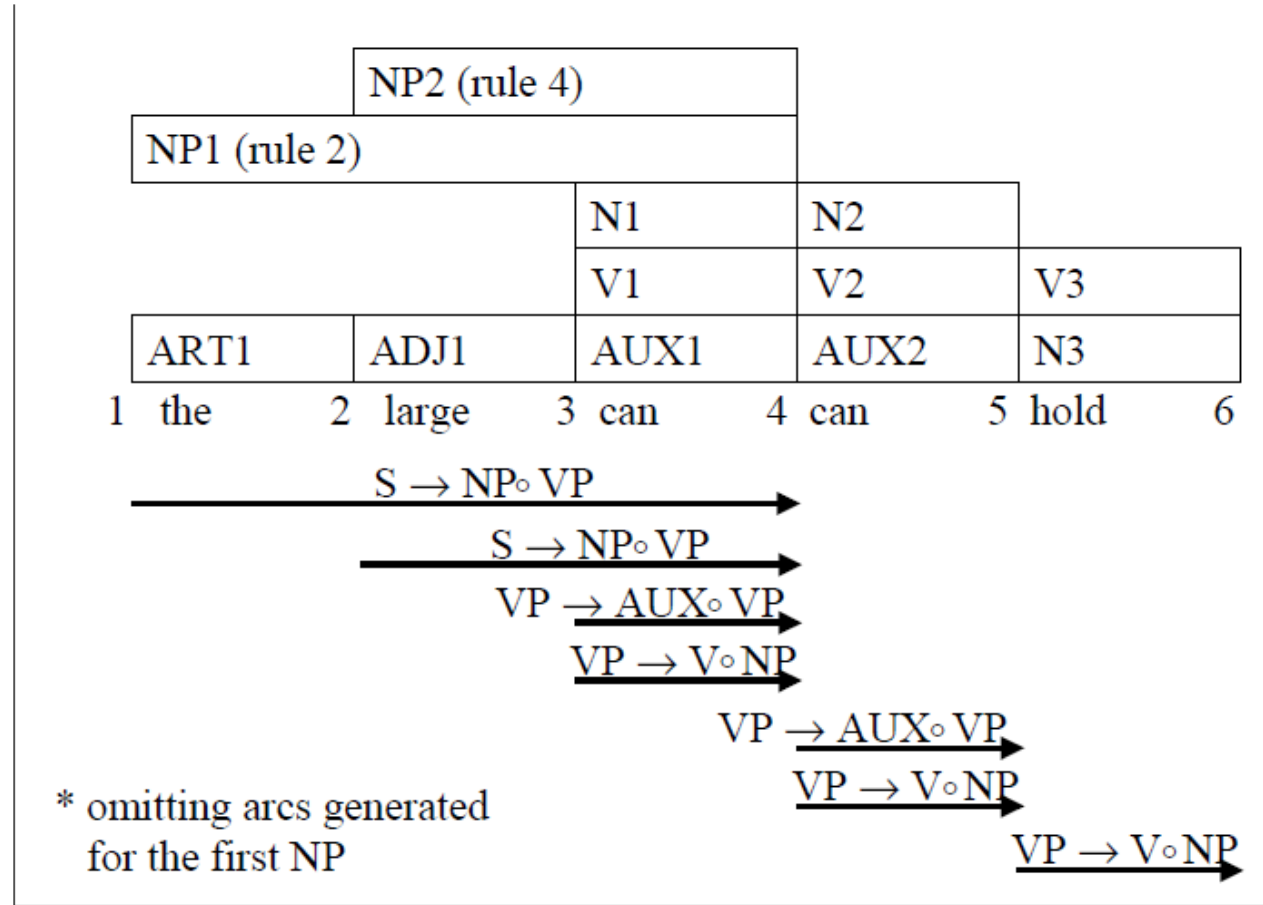

using the following Grammar 2 and following lexicon:

the:	ART
large:	ADJ
can:	N, AUX, V
hold:	N, V
water:	N, V

After parsing 'the large can'

After adding 'hold'

The final chart

S1 (rule 1 with NP1 and VP2)							
		S2 (rule 1 with NP2 and VP2)					
		VP3 (rule 5 with AUX1 and VP2)					
		NP2 (rule 4)		VP2 (rule 5)			
NP1 (rule 2)					VP1 (rule 6)		
		N1	N2		NP3 (rule 3)		
		V1	V2	V3		V4	
ART1	ADJ1	AUX1	AUX2	N3	ART2	N4	
1 the	2 large	3 can	4 can	5 hold	6 the	7 water	8
